

## Choose Trusted Toner Cartridge Supplier Online

Toner powder is used in Laser Printers. It is contained inside cartridges that fit into the machine. The powder heats up and prints beautiful images and text. There are many interesting facts about toner formation, replacement requirements, refilling and recycling of cartridges, ways to remove it from clothes and hands, and toner's effect on human health. Let's discuss all these points in detail.

### **Types of colour employed in toners:**

Black-and-white printers print only in black ink. The white of the paper makes the black appear black. Colour laser printers use four colours—cyan (blue), magenta, yellow, and black—to create amazing images.

### **Toner formation:**

Basically, toner is a mixture of four components: colour pigments, synthetic resin, magnetizable metal oxides and a small number of agents like silicon and wax. The composition of the mixture varies depending on the purpose for which it will be used. Normally toner powder particles range from 5 to 30 microns, which makes it look like a liquid form and helps it flow without shaking.

### **Toner replacement:**

When toner runs out in a laser printer, you need to replace it immediately. The printer has an indicator that warns you when the toner is running low. If you have installed printer drivers on your system, an icon may appear on your desktop or in a notification area that warns you when your toner is low. Note, however, that each printer manufacturer uses different parameters for determining when to replace a cartridge, so don't trust the notification completely until you have actually printed some black pages and seen them come out blank.

#### **Toner Removal From Skin & Clothes:**

Toner powder is made of very tiny particles that include pigments, metal oxides, and resin. Resin dissolves pretty quickly, which means it melts easily when put on your skin. To wash it off, use cold water. Never use warm water because it will only make the toner stick harder onto your skin or clothes.

#### **Effects on human health:**

The use of printer toner in office is unavoidable. Many studies have shown that inhaling the toner dust in larger quantities could be dangerous for your health. Therefore, it is better to place your printer away from the desk where you regularly sit while changing its cartridges. It's better to wear disposable gloves while changing them and pay attention to pollution-free toners when purchasing a new one.

Tone Store is your [one-stop Toner cartridge Supplier](#) to buy a wide range of toners from top brands. Shop online to save big on your toner cartridge!
