We strongly believe that our service can bring your idea to the next level & assure that we will provide you with the best app development services with affordable prices. Looking forward to your response

What is clickjacking?

Clickjacking is an attack that tricks a user into clicking a webpage element which is invisible or disguised as another element. This can cause users to unwittingly download malware, visit malicious web pages, provide credentials or sensitive information, transfer money, or purchase products online.

Clickjacking attack example

- The attacker creates an attractive page which promises to give the user a free trip to Tahiti.
- In the background the attacker checks if the user is logged into his banking site and if so, loads the screen that enables transfer of funds, using query parameters to insert the attacker's bank details into the form.

Clickjacking mitigation

Client-side methods – the most common is called Frame Busting. Client-side methods can be effective in some cases, but are considered not to be a best practice, because they can be easily bypassed.

Clickjacking test – Is your site vulnerable?

A basic way to test if your site is vulnerable to clickjacking is to create an HTML page and attempt to include a sensitive page from your website in an iframe. It is important to execute the test code on another web server, because this is the typical behavior in a clickjacking attack.

Apart from that, we have written a complete blog on [What is Clickjacking](#). If you want to know more about it, so kindly click on the below link and read and enjoy!
